Aspiring Software Engineer seeking a Software Engineering / Full-Stack Development internship

Education

St. Peter's College of Toril, Inc.

Bachelor of Science in Information Technology

Aug 2023 – Expected March 2027

Davao City, Davao Del Sur

Relevant Coursework

- Data Structures & Algorithms
- Database Systems
- Object-Oriented Programming
- Event-Driven Programming

Projects

Biometric Attendance System | *Python, FastAPI, TypeScript, React, PostgreSQL*

Jan 2026

- Engineered a FastAPI and SQLAlchemy backend coordinating ESP32 fingerprint devices in real time via WebSockets.
- Implemented JWT authentication with bcrypt hashing, role-based access, and token blacklisting for secure logout.
- Built attendance validation enforcing event time windows, program eligibility, and duplicate-record prevention.

StratRealms | *Java, JavaFX, SQLite*

Sept 2026

- Built a full desktop tactical strategy game in Java/JavaFX inspired by Stratego, featuring 8 factions, AI opponents, and local Wi-Fi multiplayer over a custom network transport layer.
- Designed a persistent SQLite data layer (JDBC) for player profiles, achievements, match history, and custom formation editing, plus a JSON-based state serializer enabling full save/resume support.
- Packaged the application into a native Windows installer with jpackage and shipped a public beta to itch.io.

VaultPass | *Python, Django, JavaScript, React, PostgreSQL*

Jul 2026

- Built a personal password manager implementing end-to-end AES-256-GCM encryption and PBKDF2 key derivation.
- Integrated WebAuthn biometric authentication (fingerprint, Face ID, hardware keys) alongside JWT-based auth with token rotation.
- Designed a normalized PostgreSQL schema across 4 modular Django apps with role-based permissions and secure session handling.

GitStats | *Python, Django, JavaScript, React, PostgreSQL*

Aug 2026

- Built a multi-tenant Django REST API that syncs GitHub repositories, stars, forks, and contributor activity, and auto-generates a live, always up-to-date GitHub profile README.
- Implemented secure GitHub authentication via Firebase Identity with server-side OAuth token exchange, keeping the client secret off the browser.
- Designed a rule-based auto-categorization engine that classifies repositories (Web, Mobile, AI, API, CLI, IoT, Game, etc.) with confidence scoring, and built a Celery-powered background task queue for scheduled README auto-updates.

Experience

Full-Stack Developer (Academic & Personal Projects)

2024 – Present

Self-Directed — Coursework & Independent Projects

Remote

- Shipped full-stack web and desktop applications across academic and personal projects, applying industry-standard engineering practices end-to-end.
- Worked across the full stack using React, Django, FastAPI, and Java; integrated cloud services including Supabase, Firebase, Render, and Vercel.
- Served as the sole full-stack developer on a capstone team, independently building and deploying a biometric attendance system on schedule.

Technical Skills

Languages: Java, JavaScript, Python, TypeScript, C#, PHP, C++

Frontend: HTML, CSS, React, Next.js, React Native, Tailwind CSS, Bootstrap

Backend: Django, FastAPI, Spring Boot, Laravel, Express

Databases: MySQL, PostgreSQL, SQLite, MongoDB, Firebase, Supabase

Tools: Git, GitHub, Postman, Figma, Render, Vercel, Docker

Certificates

- **Java Fundamentals** | *Coddy* — Jul 2026
- **Python OOP** | *Coddy* — Aug 2026
- **Java Logic & Flow** | *Coddy* — Jul 2026
- **SQL Fundamentals (SQLite)** | *Coddy* — Aug 2026
